

Services:

Web Development > Custom Database Programming

BuzzBoltMEDIA has experience developing custom programming that serves up data from your pre-existing databases to solve your unique business challenges.

Dynamic components increase the level of interactivity your organization can have with visitors to your web site. More interactivity can equal increased traffic and a more pleasurable user experience if the technology is harnessed to provide activities that are useful and desirable to your visitors.

There are many things a database can do to bring your site alive and make its content dynamic. Some examples would be:

- Events Listings
- Classified Advertisements
- Job Postings
- News Database (to which your staff can add news stories, press releases, etc., and which would sort each story in reverse chronological order, displaying a summary linked to each story)
- Guestbook
- Threaded Discussion Board
- Membership Directory with member search
- Products database with search functions, cross-referencing functions
- FAQs

We have the technology to tie into your existing ERP systems to provide access to functions currently performed by your staff, such as order status, transaction tracking, project approvals and more effectively streamlining your business processes and saving you money.
