Web Development & Testing > QA Testing

Let's face it. Quality Assurance testing web-based products is really complicated. There are many different scenarios, from how the user accesses (dial up to high speed dedicated lines) with what type of computer (Macintosh, PC, or something more unusual) on which browser (Internet Explorer, Netscape, Opera, AOL, etc.), and to exactly which version of that browser they use, just for starters. Then one needs to test for the monitor's display size and color settings, and what changes individual users may have made to the font display settings in their control panels or in their browser options.

These factors alone are a daunting task to accomplish, and it doesn't even begin to touch the tip of the iceberg because there is also HTML code to validate, forms to test, as well as email addresses and hyperlinks to verify. There is custom JavaScript, VBScript, ASP, PERL, and so many other bits and pieces to be tested, that it could conceivably keep your web site from ever launching. And don't get us started with technologies requiring plug-ins like Macromedia® Flash™ or ShockWave™...

Our breadth of QA Testing services include:

- Graphics Optimization
- Browser Compatibility
- HTML Validation
- JavaScript Code Validation
- VBScript Code Validation
- Link Check
- Load Time Check
- Display Compatibility
- HTML Table Formatting
- Spelling
- Email Form Validation
- Database Connectivity
- Load and Performance Testing
- Web Functionality/Regression Testing
- Web Site Security
